Sexual Assault Statistics

* More than 75% of college students who experience unwanted intercourse are under the influence of alcohol or drugs at the time of the incident.

* Sixty percent of college women who have acquired sexually transmitted diseases (including AIDS) were under the influence of alcohol at the time they had intercourse.

* Between 15 and 30% of college women have been the victim of acquaintance rape at some point in their lives.

* Two-thirds of rape victims between the ages of 18 and 29 know their attackers and over 60% of rapes occur in residences.

Party Smart

There are simple steps that can help reduce the risks of a substance-related sexual assault:

1. Do not leave beverages unattended.
2. Do not take any beverage, including alcohol, from someone you do not know well and trust.
3. At a bar or club, accept drinks only from the bartender, never from a bartender.
4. Be alert to the behavior of friends. Anyone appearing disproportionately intoxicated in relation to the amount of alcohol they have ingested, may have consumed a tampered beverage.
5. Anyone who suspects that they have ingested a tampered drink or sedative-like substance should be taken to a hospital emergency room or should call 911 for an ambulance. Be sure to ask that a drug screen be administered and keep a sample of the beverage for analysis, if possible.
6. Make your own mixed drinks (from your own bottle), and open your own beverage.

Drugs & Alcohol and Sexual Assault

The dangers and realities of sexual assault are exaggerated when drugs and alcohol become involved. Alcohol and drugs can inhibit resistance, increase aggression and impair decision-making skills. Sexual assault and acquaintance rape are types of violence that are most likely to occur in social settings that foster rape-supportive attitudes and norms.

A study published in the Journal of Sex Education and Therapy reported that of those female students who had been victims of some type of sexual aggression while in college—from rape to intimidation to illegal restraint—91 percent of their male assailants had been drinking at the time of the attack.

Alcohol and drug use exaggerate problems with misinterpretation of sexual intent and can be used to justify assault. Studies show that many college men believe that alcohol increases arousal and legitimates non-consensual aggression. They also report that many college men believe that women who had one or more drinks are more interested than other women in having sex.

Rohypnol

What is it?

Rohypnol (roh-uh-pnol) is marketed by Roche Pharmaceuticals and is sold in 64 other countries primarily as a treatment for severe sleep disorders. However, it is not manufactured or sold in the United States. On the street it is often called "rookeys," "rooki," "R-2," "rib," and "ropes." This drug is a very potent tranquillizer similar to Valium, but much, much stronger.

Rohypnol produces sedative effects, amnesia, muscle relaxation, and a slowing of psychomotor responses. The drug is often distributed on the street in its bubble packaging which makes it appear legitimate and legal. Rohypnol is reportedly sold for $2 to $3 per tablet.

Originally, the drug was used to relieve anxiety and stress. It was reported first being "modified" in the United States in the early 1990s, and has appeared in over 23 other countries.

What are the effects?

The Rohypnol side effects begin approximately 20-30 minutes after taking the drug and peak within two hours. Depending on the dosage, the effects usually last up to 8 hours.

- Decreased blood pressure
- Loss of memory
- Trouble walking
- Problems with balance
- Diarrhea
- Nausa

- Black outs
- Sedation
- Muscle relaxation
- Disorientation
- Nausea

- Aggressive behavior
- Fearfulness
- Hiccups
- Dizziness

A date rape drug

One of the most common abuse patterns is to use Rohypnol as a rape drug. Rohypnol is known as a rape drug because perpetrators reportedly slip it into victim’s alcohol drink causing them to black out. Rohypnol takes away a victim’s normal inhibitions, leaving them helpless and blocking the memory of a rape or assault.

Only 10 minutes after ingesting Rohypnol, a person may feel dizzy, disoriented, too hot or too cold and nauseated. They may also have a difficult time speaking and eventually, the victim will pass out. The person will then have no recollection of the events that have occurred.

Mixing "roombies" with alcohol can be even more dangerous and may cause respiratory depression, asphyxiation, and possibly death.

Rohypnol has been reformulated to make it easier to detect if put into an alcoholic beverage. The new tablet dissolves more slowly and is supposed to turn a clear drink blue, a beer green, and a dark drink murky.
GHB (Gamma-Hydroxybutyrate)

What is it?

Originally developed as an anesthetic, GHB is a naturally occurring 4-carbon molecule sold in powdered, liquid or capsule form. On the street it can be known as “G,” “Liquid X,” “Liquid E,” “Scoopy,” “Soup,” “Cool,” “Ghettos Body Farm,” “Georgia Rose Roy,” “Natural Sleep-Aid,” “Easy Lay” or “Gamma 10.” It usually is tasteless, but may be recognized at times by a salty taste.

GHB was formerly sold by health-food stores and gyms as a sleep aid, anabolic agent, for better muscle definition and natural aphrodisiac. It was first synthesized in 1966 by a French researcher. It has been used in Europe as a sexual stimulant, in treatment for insomnia and narcolepsy, and in animal training and as a treatment for alcoholism and alcohol withdrawal syndromes.

In the last five years it has been gaining popularity as a “recreational” drug offering an alcohol-like hangover free “high” with possible pronounced effects (anhedonia when cues and inhibitions are repressed).

What are the effects?

GHB side effects are usually felt within 5 to 10 minutes after ingestion and usually last no more than two to three hours. The effects of GHB are unpredictable and very dose-dependent.

Sleep patterns, agitation, delirium and hallucinations have all been reported. Other effects include excessive sedation, increased agitated restlessness, and up to 50 percent of users. Dizziness may occur for up to two weeks post ingestion. GHB can cause severe reactions when combined with alcohol, benzodiazepines, opiates, anticonvulsants, and sedative-hypnotics. There is no known antidote for GHB.

In November 1997, the Food and Drug Administration issued a warning that GHB can cause severe, acute, respiratory arrest and death, especially when mixed with alcoholic beverages. GHB is no longer legally sold in the United States.

Side effects of GHB:

- Abrupt, intense drowsiness
- Nausea
- Giddiness, alliness and dizziness
- Interference with mobility and verbal coherance
- Convulsions
- Decreased heart rate
- Sleep-walking
- Decreased body temperature
- Sweats, deep respiration
- Temporary amnesia
- Secret-eliminations
- Seizures
- Coma
- Death

Another date rape drug

One of the most common abuse patterns of GHB is by means of slipping the drug into a victim’s drink (usually alcoholic). Within a few minutes, the victim will begin to appear drunk and helpless. Often the perpetrator will become a “good Samaritan” and offer to escort the victim home. When the victim regains consciousness, he or she has no memory of the events. GHB is known to be in the Manhattan area.

New Legislation

The “Drug-Induced Rape Prevention and Punishment Act of 1996” is a new law (Public Law 104-328). Under this law, anyone convicted of the crime of rape by means of administering GHB or any other similar drug or substance is sentenced to life imprisonment. For repeat offenders, GHB possession is punishable by up to three years in prison.
Alcohol and Rape

Alcohol can affect both men and women, but most importantly, it also affects those skills that can protect a person from being involved in a sexual assault. In particular, there are four useful skills and these skills form the word R A P E.

R: Realize what situations place you in danger of committing rape or being a victim of rape.
A: Avoid and manage conflicts with partners and intimates.
P: Practice clearly what others are doing.
E: Establish and communicate your desires and limits about sex.

When drinking alcohol, people’s thinking can get distorted. Therefore, they can miss important signals such as voice or behavioral changes. They are also less likely to avoid or talk their way out of a conflict.

Communication is very important, but men and women who have been consuming alcohol can be less able to communicate what they want and do not want out of a sexual relationship. The odds that “maybe” or “no” will be interpreted incorrectly increase when either party has been drinking.

Some perpetuators may want their victim to drink so the victim will be less likely to resist physical or emotional pressure to engage in sexual activity.

Regardless of how much a person drinks, no one is ever justified in forcing sex if the other party resists, says “no” or is under the influence of alcohol.
